Note on the Synthesis of Structures of Multiple-
Looped Control Systems Including Elements with Lag
(K sintezu struktur mnogosvyaznogo regulirovaniya pri
nalichii elementov s zapazdyvaniyem).

PERIODICAL: Avtomatika i Telemekhanika, 1957, Vol. 18, Nr 12,
pp. 1098-1108 (USSR)

ABSTRACT:

This paper is a continuation of previous publications
(reference 1-3). As an additional factor systems are in-
vestigated here, comprising multiple looped control, where
a section of the circuits (or all of them) contain elements
with lag, just as in the case of the papers referred to by
1-3, the following task is given here:
1.) The structure is to be found of such systems with
multiple-looped control and with elements with lag, which
permit an unlimited increase of the amplification coefficients
of single circuits without disturbing the stability of the
whole system. The basic properties of these structures from
the viewpoint of the statics and dynamics of the process
of an automatic control are to be determined. On the basis

Card 1/3

Note on the Synthesis of Structures of Multiple-
Looped Control Systems Including Elements with Lag

103-12-3/12

of the investigations conducted here, it is shown, that it is necessary and sufficient for the purpose of keeping a control system with multiple-loops and with elements with lag even in the case of an unlimited increase of its amplification coefficients in a stable state, to demand, that every separate control circuit, the amplification coefficient of which is in a condition to increase unlimitedly, belongs to that class of systems, with respect to its structure, which remain stable even in the case of an unlimited amplification coefficient. It is shown, that the introduction of stabilizing arrangements at the input guarantees an additional excitation of the type $\sum a_{ik} x_k$ and the increase of the amplification coefficient K_{iox} the independent course of the process in every single circuits of the control system with multiple loops and elements with lag. In that case, conditions ensuring the stability of the system on an unlimited increase of the amplification coefficient must be satisfied, of course, a_{ik} denotes the coefficient, determining the interrelation

TITLE: Theory of the Structure of High-Speed Automatic Control Systems (Teoriya postroyeniya struktur bystrodeystvuyushchikh sistem avtomaticheskogo regulirovaniya)

PERIODICAL: Avtomatika i telemekhanika, 1958, Vol 19, Nr 7,
pp. 621 - 632 (USSR)

ABSTRACT: In the references 1-3 the rules for the composition of the structures of automatic control systems which are stable in case of an unlimited increase of the amplification factor were stated. Here the investigations on the synthesis of such structures, with in the frame of which practically an arbitrary range of the positive real frequency characteristic can be obtained, were continued. I.e. a system with an arbitrary frequency transmission range can be obtained. Such systems have a high amplification factor not only at zero frequency but over the whole frequency range. The stabilizing devices hereby have a transmission function of the type $\mu/F(p)$. The possibility is explained of using elements with transmission functions $\mu/F(p)$, where μ is a constant, as stabilizing elements. A structure scheme of an automatic control system of N elements with transmission functions

Card 1/4

Theory of the Structure
Automatic Control Systems

of High-Speed

103-19-7-1/9

K_i

$\frac{D_i(p)}{F_i(p)}$ is investigated. n of these elements are comprised by stabilizing devices and this in form of local feedbacks with transmission functions

$\frac{\mu_i}{F_i(p)}$. It is assumed that the amplification factors of these

n elements can be varied within wide limits in the special case arbitrarily increased. First the transmission function of the given scheme is determined. Then the properties of the system are determined. It is shown that for the systems of the examined type the following property of the structure is valid as necessary condition for the stability at $K_i \rightarrow \infty : d_i + v_i \ll 2$. Here 3 cases are possible: 1) $v_i = 0$. The case of the introduction of a rigid feedback. 2) $v_i = 1$. The stabilizing device is an integrating or an aperiodical member. This is the case with a transmission function of the type

Card 2/4

Theory of the Structure
Automatic Control Systems

of High-Speed

103-19-7-1/9

$\frac{\mu_i}{1 + \tau_1 p}$. 3) $v_i = 2$. The stabilizing member is a member of second order. This is the case with transmission function of the type

$\frac{\mu_i}{ap^2 + bp + 1}$. All three cases here are discussed in detail.

Subsequently general considerations are given. It is shown that no conclusions on the properties of the system can be drawn if considerations are only based upon the fact that some of the operator multiplicands can be shortened as a consequence of the inversion of the transmission functions of the stabilizing devices by amplifiers with high amplification factors. This can lead to great errors. Therefore in all cases first the stability conditions of the auxiliary and of the degenerate equation must be explained and then only on the base of these conditions one must choose the

Card 3/4

Theory of the Structure
Automatic Control Systems

of High-Speed

103-19-7-1/9

values of the constants of stabilizing devices. Finally methods for the consideration of the restrictions which are conditioned by the non-linearity of the characteristics of some elements are shown. Summarizing, it is stated that methods for the structure synthesis with principally arbitrary reproduction accuracy were obtained. There are 3 figures and 9 references, 9 of which are Soviet.

SOV 1986

Meyerov, Mikhail Vladimirovich

Sintez struktur sistem avtomaticheskogo regulirovaniya vysokoy
tochnosti (Synthesis of Structures of High-precision Automatic
Control Systems) Moscow, Fizmatgiz, 1959. 284 p. Errata
slip inserted. 10,000 copies printed.

Ed.: O.K. Sobolev; Tech. Ed.: S.S. Gavrilov.

PURPOSE: This book is intended for designers, technical personnel,
and students in the field of automatic control systems.

COVERAGE: This book deals with the synthesis of precision auto-
matic control systems. It is claimed to be the first book to
systematically present material on the synthesis of structures
of automatic control systems. The term structure as used in
the book refers to the dynamic properties of systems and their
component elements, as described by their transfer functions.
Thus, physically different systems (electric, hydraulic, etc.)
can have the same structure. Problems of stability are dealt
with, and an attempt is made to establish scientific principles

TITLE:

Some structural properties of multidimensional control systems

SOURCE:

International Federation of Automatic Control. 1st Congress Moscow. 1960. Teoriya nepreryvnykh sistem. Spetsial'nyye matematicheskiye problemy. Moscow, Izd-vo AN SSSR. 1961. Trudy. v 1, 201-211

TEXT: The dependence of the character of the relationships between the controlled variables on the structure of multidimensional systems is considered. This dependence is related to the properties of the system and in particular to their autonomy and invariance. The differential equations are set up for the most general case when the controlled variables are connected simultaneously through the controlled object (process), the measuring device and the load. Thereby two cases are considered:
(a) The control systems with respect to each variable are single-loop

Card 1/5

S 589/61/001 '000/006/019
D274 D304

Some structural properties

and (b) multiloop. Case (a). It is assumed that the object has n variables. The following notations are introduced with respect to the i-th controlled variable: k_i — the gain; $D_i(p)$ — the operator of the object; y_i — the controlled variable; y_{ir} — the reference variable; γ_{ik} — a factor which characterizes the relationship between the i-th and the k-th variable; α and β characterize the measuring device; φ and ψ — characterize the control mechanism; f_k — the load. In operator notation, the object is described by

$$D_i(p)y_i(p) + k_i = \sum_{k=1}^n \gamma_{ik}(p)y_k(p) + \varphi_i(p) + \left[\sum_{k=1}^n \gamma_{ik}(p)f_k \right] \quad (1)$$

After transformations, one obtains

Card 3/5

Some structural properties...

31391

S/589/61/001/000/006/019
D274/D304

Particular cases of Eq. (6) are: multidimensional servomechanisms (if α and β are zero) and combined control systems (if α and r are zero). From Eq. (6), it follows that the connection between the controlled variables will be the stronger, the larger the gain of the object, and the weaker—the larger the gain of the controller. The mutual influence of the controlled variables can be reduced to an arbitrarily small value by corresponding increase of the controller gain. Thereby, the system should remain stable. Thus, the problem of invariance or autonomy reduces to system stability with arbitrarily large gain. However, for single-loop systems, an infinite gain leads unavoidably to instability. If, however, derivatives (from the (n-2)-nd to the first) are introduced into the control loop, a single-loop system with a gain approaching infinity can be realized. Case (b): An equation, analogous to Eq. (6) is obtained. From the obtained equation it follows that the character of the relationships between the variables is determined by six terms involving the gain factors and the operators of the controller and of the compensating network. Further, the system autonomy is considered for $r_{ik} = 0$. For configurations which remain stable with infinite gain factors, the overall gain can be

Card 4/5

Some structural properties...

31321

S/569/61/001/000/006/019
D274/D304

infinitely increased. In this case (i.e., with sufficiently large overall gain), the system is autonomous to within ξ in steady-state conditions. Further, the conditions are ascertained under which the system remains stable when the gain approaches infinity. Multidimensional combined systems: These are systems which are controlled by both deviation and load. In the references, it was established that the invariance of a controlled variable with respect to the load can be realized if between the point of application of the disturbance (load) and the point where the controlled variable is measured there are at least two circuits. In the case under consideration this means that the system will be invariant if it is a combined system. This statement is illustrated by the example of a system with 3 interrelated variables. The conclusion is reached that, if the system is designed according to the Polzunov-Watt principle, the influence of the loads can be eliminated (to within ξ) only in configurations which permit an unlimited gain factor without loss of stability. The discussion contained only a comment by M. N. Babushkin, which was of a critical nature. There are 2 figures and 6 Soviet-bloc references.

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye
tekhnicheskikh nauk. Energetika i avtomatika,
no. 6, 1961, 21 - 29

TEXT: The article considers certain properties of multiply-coupled control systems, where the couplings between individual regulated parameters occur through the controlled object and measurement system, where the control circuits for each individual regulated parameter have a single-loop structure consisting of basic element - the controlled object, measurement system, amplifiers and control organs. Each regulated quantity corresponds to a separate transfer function. The article takes into account inertial elements in the control loops. Matrix notation is used for the system equations as it is clearer and simplifies the investigation. A general expression is obtained for the regulated quantity in the form of a column vector. The concept of error coefficient matrix for the general case of a multiply-

Card 1/2

✓

Multiply-coupled control systems

S/024/61/000/006/003/019
E140/E335

coupled control system is introduced, which is analogous to the form introduced in the paper of N. Colomb and E.J. Justin (Ref. 2: Franklin Institute, 1952, No. 2). The error coefficient matrix is the product of two matrices which are dependent on the coupling coefficients in the error coefficient matrix of each separate system. The following general conclusions are obtained: the mutual influence of the error coefficients of different circuits will be the weaker, the higher the amplifications in the individual systems and the stronger, the greater are the coupling factors through the object and the measurement system.

TITLE: On the possibility of noise-suppression in a class of dynamic systems

PERIODICAL: Avtomatika i telemekhanika, v. 22, no. 10, 1961, 1314-1322

TEXT: It is shown that for a certain class of configurations, namely those which permit an unlimited increase in the gain factor without becoming unstable, the noise can be suppressed (under certain conditions) by increasing the gain factors of certain elements. Both single-parameter systems and multidimensional systems are considered. Fig. 1 represents a block-diagram of the single-parameter system. The input signal x_{in} is assumed to be noise-free. The transfer functions of the noise-free elements are denoted by $K_i R_i(p)/D_i(p)$. For the elements which are affected by noise, it is assumed that the noise and signal are applied at different points; the respective transfer functions are $K'_i R'_i(p)/D'_i(p)$. The

Card 1/6

On the possibility...

29247

necessary condition for this class of systems is that the first element be noise-free. From the transfer functions of the system (Fig. 1), the expression

$$\begin{aligned}
 & \left[m^2 \prod_{i=1}^4 D_i(p) D_2'(p) D_4'(p) + D_2'(p) D_4'(p) \prod_{i=1}^4 R_i(p) K_2 K_4 \right] x_{out} = \\
 & = D_2'(p) D_4'(p) \prod_{i=1}^4 R_i(p) K_2 K_4 x_{in} + \\
 & + m D_1(p) D_2(p) D_4'(p) R_3(p) R_4(p) R_2'(p) K_2 K_4 f_1 + \\
 & + m^2 \prod_{i=1}^4 D_i(p) D_2'(p) R_4'(p) K_4' f_2
 \end{aligned} \tag{6}$$

Card 2/6

On the possibility...

29247
S/103/61/022/010/006/018
D274/D301

is obtained, where $1/K_1 = 1/K_3 = m$. If the system remains stable for $m \rightarrow 0$, Eq. (6) yields: $\lim_{m \rightarrow 0} x_{out} = x_{in}$. In other terms, if the system remains stable with infinitely large gain factors of the elements not directly subjected to the noise, the signal can be reproduced to any accuracy required. In this case, the configuration is characterized by the fact that the noises are suppressed by the gain factors of the elements which are placed between the input and the element which is affected by the noise. The above system is realizable if it remains stable with infinitely large gain factors. The system's stability is determined by the roots of the equation

$$m^2 \prod_{i=1}^4 D_i(p) + K_2 K_4 \prod_{i=1}^4 R_i(p) = 0 \quad \text{for } m \rightarrow 0 \quad (8)$$

The roots of Eq. (8) will lie to the left of the imaginary axis if:

and N_1 of the polynomial $\prod_{i=1}^4 R_i$; (b) the equation $\prod_{i=1}^4 R_i(p)K_2 K_4 = 0$

should satisfy the stability conditions; (c) the coefficients of the polynomials of Eq. (8) should satisfy a given relationship, depending on whether $N_2 = N_1$ equals two or unity. Further, the case which is most

difficult to realize in practice is considered. Denoting $\prod_{i=1}^n K_i \prod_{j=1}^N K_j = 1$, K_{deg} , one obtains

$$v \prod_{i=1}^N (1 + T_i p) + K_{deg} = 0 \quad (9)$$

where N is the number of elements (all of which are aperiodic), v --the

Card 4/6

On the possibility...

number of elements (among N) with large gain factor. N-2 amplifiers are introduced into the system. Fig. 2 shows such a system. After transformations, one obtains

$$K_2 K_4 \prod_{i=1}^{N-2} (1 + T_i p) = 0 \quad (18)$$

which satisfies always the stability conditions: The necessary and sufficient stability condition involves an auxiliary equation and can be ensured by appropriate choice of T_i and of $K_2 K_4$. In the case of a multidimensional system, too, the noise in the i-th circuit can be suppressed by increasing the gain factor. The system can be considered as composed of n noninteracting simple systems. It follows that the stability of the multidimensional system can be ensured; hence, such a system is feasible. There are 3 figures and 14 references: 13 Soviet-bloc and 1 non-Soviet-bloc. The reference to the English-language publication reads as follows: N. AUTHOR: Meyerov, M. V.

TITLE: Structural noise stability of a class of closed dynamic systems

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 139, no. 4, 1961, 827-829

TEXT: Subject of investigation is a closed dynamic system which, in special cases, is equivalent to automatic control systems or other systems with negative feedback. The system consists of N components with the transmission functions $K_i R_i(P)/L_i(P)$. For reasons of simplifying the mathematical treatment of the problem under investigation, it is assumed that the total number of components subjected to noise action amounts to $a + m$, the components being arranged at different spots of the feedback circuit. The a components are supposed to be placed at one spot and the remaining m elements at another; between a and m 3 elements are interposed, which are not subjected to the action of a noise. The results obtained under these conditions can easily be applied to any arrangement of the components. Studies conducted here are based on the condition that at the input the

S/C4/8231

Structural noise stability of ...

useful signal is undisturbed, and that the first ν components are not subjected to the action of a noise. Since the noise acts not only on the input of a component, it may be assumed that the transmission function from the output of a given component to a spot where the noise is acting differs from the transmission function of this component. This kind of transmission function is denoted by $K'_i R'_i(P)/D'_i(P)$. A schematic representation is shown

in Fig. 1. The author proves the following property of the systems under investigation, which he refers to as structural noise stability: The degree of accuracy obtainable in the reproduction of a useful signal applied to the input of a system will be the greater the greater is the amplification factor of those components which are not subjected to noise action; suppression of noise is caused by such components of the dynamic circuit as are subjected to the action of noise. To furnish proof of this statement, the transmission function of the system shown in Fig. 1 is derived.

$$x_{i+1} = \frac{K_i R_i(P)}{D_i(P)} x_i. \quad (1)$$

Card 2/6

25840
S/020/61/139/004/006/025

Structural noise stability of ...

holds for components that are not subjected to the action of noise while

$$x_{I+1} = \frac{K_I R_I(P)}{D_I(P)} x_I + \frac{K'_I R'_I(P)}{D'_I(P)} f_I. \quad (2)$$

is valid for components that are subjected to noise action. By denoting the useful signal by $x_{\alpha\beta\gamma}$ and the output signal by $x_{\alpha\beta\gamma\delta\epsilon\zeta}$,

$$\begin{aligned} & \left[\prod_{i=1}^{\alpha+\beta+m} \frac{K_i R_i(P)}{D_i(P)} \frac{K_n R_n(P)}{D_n(P)} + 1 \right] x_{\alpha\beta\gamma} = \prod_{i=1}^{\alpha+\beta+m} \frac{K_i R_i(P)}{D_i(P)} \frac{K_n R_n(P)}{D_n(P)} x_{\alpha\beta\gamma} + \\ & + \frac{K_n R_n(P)}{D_n(P)} \prod_{i=\alpha+1}^{\beta+m} \frac{K_i R_i(P)}{D_i(P)} \sum_{\alpha+1}^{\alpha+m} \prod_{i=\alpha+1}^{\alpha+i} \frac{K'_{\alpha+i} R'_{\alpha+i}(P)}{D'_{\alpha+i}(P)} \frac{K'_{\alpha+i-1} R'_{\alpha+i-1}(P)}{D'_{\alpha+i-1}} f_{i-1} + \\ & + \frac{K_n R_n(P)}{D_n(P)} \sum_{i=2}^{m+1} \prod_{\alpha+1}^m \frac{K_{\alpha+i+\beta+i}(P)}{D_{\alpha+i+\beta+i}(P)} \frac{K'_{\alpha+a+\beta+i-1} R'_{\alpha+a+\beta+i-1}}{D'_{\alpha+a+\beta+i-1}} f_{\alpha+i-1} + \\ & + \frac{K'_n R'_n(P)}{D'_n(P)} f_n. \end{aligned} \quad (3)$$

$$\dots + \prod_{i=1}^m D_{v+a+\beta+i}(P) \sum_{l=2}^{m+1} \prod_{n=1}^m K_{v+a+\beta+l} R_{v+a+\beta+l}(P) \prod_{i=n+1}^l D_i(P) \times \\ \times \prod_{i=n+1}^{v+a+\beta+m} D_i(P) K_{v+a+\beta+i-1} R_{v+a+\beta+i-1}(P) f_{a+i-1} + \\ + m^{v+\beta} \prod_{i=1}^{v+a+\beta+m} D_i(P) \prod_{i=n+1}^l D_i(P) \prod_{i=n+1}^m D_i(P) K_n R_n(P) f_n.$$

provided that $1/k = m$ and that the amplification factors of such components as are not subjected to noise action are sufficiently great. This results in $\lim x_{\text{new}} = x_{\text{old}}$. It is thus obvious that noise occurs the more intensely the farther is that component away from the input, which is subjected to noise action, the greater is the number of preceding components which are not directly subjected to noise action, and the greater is their amplification factor. There are 1 figure and 1 Soviet-bloc reference.

TITLE: Synthesis of systems with rigid structures, which are equivalent to self-adaptive systems

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 147, no. 5, 1962,
1045-1047

TEXT: This is a study of controlled objects whose optimum performance is disturbed: (1) by external disturbances changing the characteristics of the object; (2) by self-induced changes in the characteristics. The resulting structure is assumed to be equivalent to a self-adaptive system, when, in case (1), the processes in the system are independent of external disturbances and when, in case (2), the sensitivity

$S_{m_2}(P)$ according to H. Bode (Network analysis and feedback amplifier

design) does not depend on the transient function of the object. The quality factor of the system is not studied. It is essential that a
Card 1/4

S/020/62/147/005/010/032

B116/B102

q-factor was chosen which in principle can be applied for the object characteristics without taking disturbances into account. Three cases are studied: (1) Measurable disturbances changing the object characteristics. (Fig. 1, without dashed line). $W_2(P)$ is the transient function of the object, $KW_1(P)$ and $W_3(P)$ are the transient functions of the control system and of the stabilizer, respectively. The latter are chosen such that optimum performance without disturbances is reached at a sufficiently high amplification factor K. The structure is chosen such that stability is reached when K tends to infinity. If K is sufficiently high, the structure in Fig. 1 without disturbances is proved to be equivalent to that with disturbances (dashed line). This means that such a system behaves like a self-adaptive one. It does not change its characteristics despite disturbances. External disturbances are compensated automatically. (2) Disturbances that change the object characteristics cannot be measured. The undisturbed object characteristics are assumed to be known. Fig. 1 is supplemented according to Fig. 2: The object model with $W_2(P)$ is introduced. Such a system is proved to behave like a self-adaptive one. (3) Self-induced changes in the object characteristics. The structure

Card 2/4

Synthesis of systems with ...

S/020/62/147/005/010/032
B116/B102

of the control system must be chosen such that the required performance depends only slightly on the changes in the object characteristics. The sensitivity $S_{W_2(P)}^{K(P)}$ can be used to estimate the effect of the change in the object characteristics on the performance. $K(P)$ is the transient function of the whole system and $W_2(P)$ is that of the object. The system is ideal when $S_{W_2(P)}^{K(P)} \rightarrow 0$. Structures that become stable at $K = \infty$ and

by introducing derivatives according to a method given by the author (Avtomatika i telemekh., 22, no. 10 (1961)) are self-adaptive systems (a typical case is shown in Fig. 3). In the general case of structures stable at $K = \infty$, performance becomes independent of the change in the object characteristics when an additional object model with invariable characteristics is introduced. There are 3 figures.

TITLE: Multiloop combined control systems

SOURCE: Avtomatika i telemekhanika, v. 24, no. 5, 1963, 628-639

TOPIC TAGS: multiloop control system, controlled variable invariance, absolute variance, Epsilon-accuracy invariance

ABSTRACT: The article studies the problem of selecting the most rational structure and parameters of multiloop combined control systems (control systems are called combined when the principle of deviation control and the principle of disturbance control are used simultaneously) using the invariance (independence) of a given controlled variable on the totality of disturbances as the criterion of the selection. A set of equations describing the multiloop combined control system with n control variables is derived with which an explicit expression for any controlled variable y_i may be written. The possibility of realizing the invariance of a controlled variable is investigated. Invariance conditions are derived in the form of a system of

Card 1/2

L 10486-63
ACCESSION NR: AP3000466

equations, which is analyzed first for the case of a simple multiloop system constructed on the principle of deviation control alone. It is shown that in this case the absolute invariance cannot be realized; it can be achieved only when the multiloop system is combined. Conditions for the realization of a simple multiloop system with ϵ -accuracy are derived. The realization with ϵ -accuracy of the invariance of multiloop combined systems is investigated, and it is proved that the invariance of such systems can be realized with ϵ -accuracy when the structure of a constructed system belongs to a class of structures which are stable when the amplification coefficient increases without bounds. Multiple loop control systems (Sistemy mnogosvyaznogo regulirovaniya) Moscow, Izd-vo "Nauka", 1965. 384 p. illus., bibliog. 6,000 copies printed

TOPIC TAGS: automatic control system, quality control, self adaptive control

PURPOSE AND COVERAGE: The book is devoted to the theory of systems for automatic control of a large number of regulated quantities, such as complicated machinery and processes in which the output of the machine or the overall characteristics of the production quality depend simultaneously on all the adjustable quantities. The main properties of multiple-loop control systems used for this purpose are described, and the various existing methods for the investigation of such systems are estimated. The book consists of a mathematical description of some typical objects and systems of multiple-loop control, derivation of the equations of the control system for various cases, general structural properties of multiple-loop control systems, combined systems, autonomy and invariance of control systems, methods of system synthesis to obtain certain specified structures, and variational problems dealing with multiple-loop control systems. Author thanks Professor A. A. Fel'dbaum for reviewing the book and for many valuable remarks which contributed to its improvement.

TITLE: International conference on multivariate and discrete automatic control
systems held in Prague on 9 - 12 June, 1965

SOURCE: AN SSSR. Vestnik, no. 12, 1965, 77-78

TOPIC TAGS: automatic control system, scientific conference, international
conference

ABSTRACT: The International Conference on Multivariate and Discrete Automatic
Control Systems was held in Prague from 9 to 12 June, 1965 within the framework
of the member nations of the Union of Economic Cooperation. Represented at the
conference were Bulgaria, Hungary, the German Democratic Republic, Poland,
the Soviet Union, Czechoslovakia. Reports were read at the plenary session by
Ya. Plugarzh, Chief Scientific Secretary of the Czechoslovakian Academy of Sciences,
dealing with a historic survey of the problems engaging the attention of the con-
ference, and by V. Streys on the contemporary theory of multivariate and discrete
systems. Three sections were set up. Within the section dealing with the synthesis

Card 1/2

L 38986-66

ACC NR: AP6003166

of multivariate automatic control systems a number of participants dealt with the invariantness of multivariate and essentially nonlinear automatic control systems and with methods for the optimization of multiply-connected systems. Particular attention was directed at control mechanism design and stability. At the meetings of the section on discrete automatic control systems and variable-structure systems the majority of the papers involved the theory of discrete systems, and problems on the realization of discrete devices and systems. A few dealt with the practical applications of the methods discussed. The majority of the reports were of great interest on the theoretical plane and attested to the high state-of-the-art in the countries represented.

ORG: Institute of Automation and Remote Control (Institut automatiki i telemekhaniki)**TITLE:** Analytic conditions for positiveness in a real function**SOURCE:** AN SSSR. Doklady, v. 165, no. 4, 1965, 780-782**TOPIC TAGS:** automatic control theory, mathematic analysis, real function

ABSTRACT: The author gives some examples of important problems in automatic control theory and network theory which may be reduced to finding conditions for positiveness in real functions. It is shown that conditions for realization of real positive functions are determined by finding conditions for stability of the equation

$$Q(p) + KR(p) = 0$$

where K is a finite positive number or infinity. The problem is formulated as follows: find the conditions under which the region of stability in the plane of the complex parameter K is the entire real positive axis. Necessary and sufficient conditions are found such that the D-partition curve never intersects the real axis K in the K-plane, in lattices which are stable when K $\rightarrow \infty$. These conditions take the following form:

$$\sum a_n p^n = 0.$$

TITLE: Deodorization of whale oil

SOURCE: Krasnodar. Nauchno-issledovatel'skiy institut pishchevoy promyshlenosti. Trudy, v. 2, 1965, 85-87

TOPIC TAGS: processed animal product, hydrogenation, hydrogenated fat, aldehyde, ketone, spectrophotometer/SF-5 spectrophotometer

ABSTRACT: Laboratory tests were made to find the effect of whale oil deodorization prior to hydrogenation and to study the composition of odor imparting substances separated from the oil during deodorization using superheated steam under vacuum. Refined, unrefined and hydrogenated batches of whale oil each 600 cm³ were deodorized and the results are presented in tabular form in the original article. The substances separated were identified with the use of an SF-15 spectrophotometer. It was found that deodorization of whale oil eliminates aldehydes, ketones and nitrogenous and non-saponifying substances. The content

Card 1/2

ACC NR: AT7003858

of carbonyl compounds in the deodorization fractions of hydrogenated oil is considerably less than in deodorization fractions of whale oil. It was found practical to deodorize the whale oil prior to hydrogenation. A unit for the preliminary deodorization of whale oil prior to hydrogenation has been installed at the hydrogenation plant of the Krasnodar Oil and Fats Complex. Deodorization of whale oil prior to hydrogenation does not eliminate the need for deodorizing the hydrogenated whale oil in margarine plants. Orig. art. has: 1 table. [GC]

TEXT: The dinitrile of terephthalic acid was converted to
p-xylylene-diamine by hydrogenation over a catalyst consisting of
an alloy of 48% Ni, 50% Al and 2% Ti. The reaction was carried out
in n-butyl alcohol in the presence of ammonia and under pressure.
Best yields of p-xylylene-diamine were obtained with 40% of the
above catalyst with the addition of ammonia (liquid) at 180°C

Points out that Adler's solution (by operator method), based on Poetsch's work, of Maxwell's equations is erroneous. Considers oscillations of a field resonator as an example of his solution.

MEYEROVICH, G. A.

Meyrovich, G. A. An operational method applied to the equations of electrodynamics in a bounded three-dimensional region. Izvestiya Akad. Nauk SSSR, Otd. Tekn. Nauk 1949, 186-191 (1949). (Russian)

It is pointed out that the solution of Adler is erroneous [J. Appl. Phys., 16, 545-550 (1945); these Rev., 7, 99]. Adler obtains for the Fourier transform of the derivative of a function the expression

$$\hat{F}[\varphi'(x)] = (j\pi n/l) \hat{F}[\varphi(x)] + (-1)^n [\varphi(l) - \varphi(-l)].$$

He gets rid of the boundary values by assuming that the function, defined for $0 < x < l$, is continued for $-l < x < 0$ in an even way: $\varphi(x) = \varphi(-x)$. The boundary values cancel, but the solution obtained in this way does not take cognizance of these boundary values, and this is erroneous. In applying this method to Maxwell's equation, Adler continues the functions E and H differently in the various equations. As a consequence the transformed equations cannot be used as a system of simultaneous equations, and

the results are of no value for computational purposes. In conclusion the author solves the problem of a prismatical cavity resonator, with perfectly conducting boundaries, taking care that each component appears in each of the equations in a similar way, and obtains for the transform of the electrical vector the expression

$$\hat{E}(n, p) = (\hat{n}' \times \mu \hat{H}(n, 0) + \mu p \hat{E}(n, 0)) / (\epsilon \mu p^2 - n'^2),$$

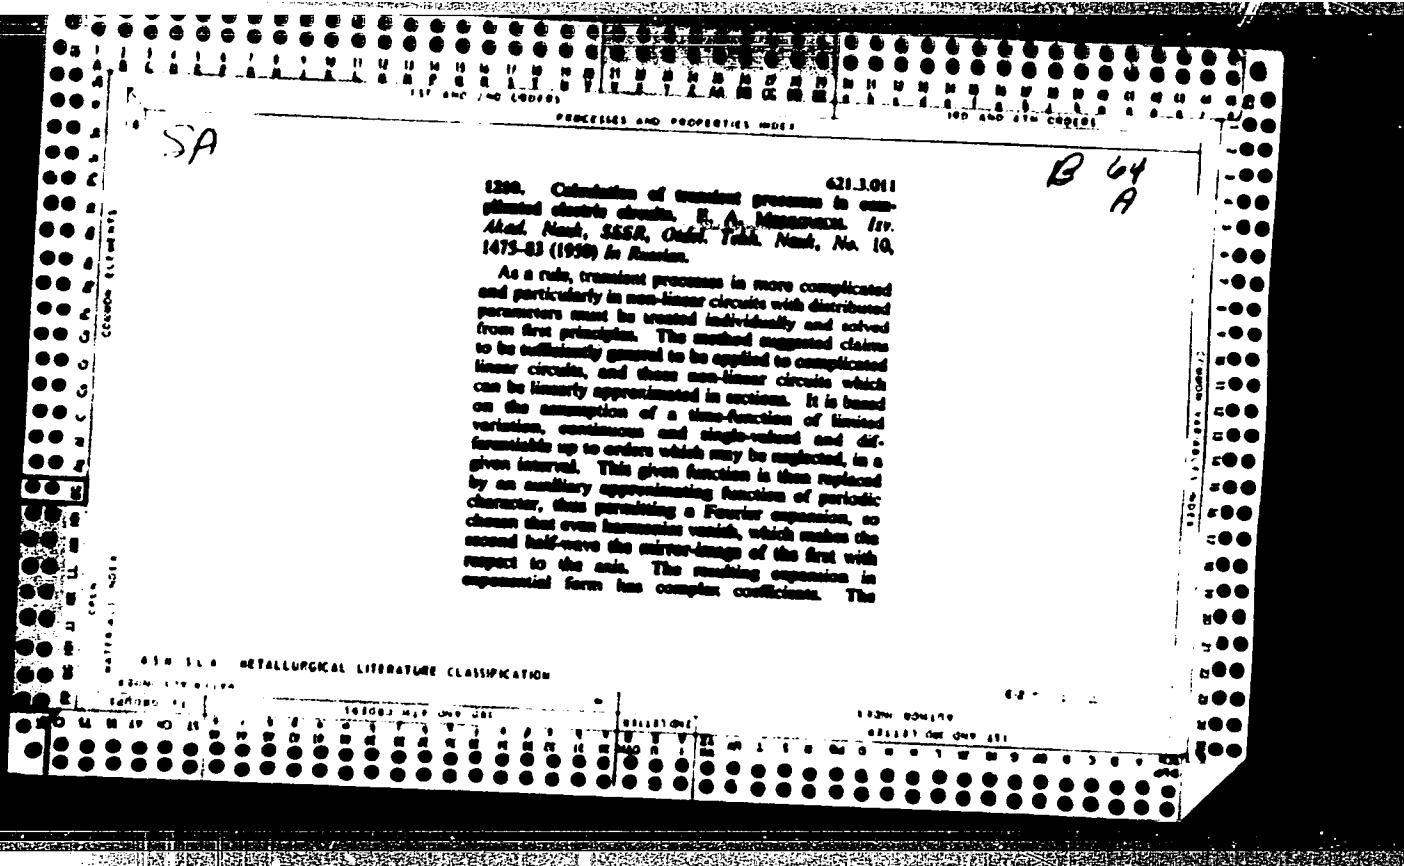

which defines each harmonic in terms of its boundary values. An expression in terms of the j -variable is also given. The oscillations are undamped since no losses are considered.

PURPOSE: This book is intended for specialists in the coal industry concerned
with the underground electrocarbonization of coal.

COVERAGE: This book describes the use of electric current for the direct treat-
ment of underground coal beds. The authors maintain that such operations call
Card 1/10

SOV/2079

for the use of a high-efficiency unit able to produce sufficient electric power and to effect the release of the chemical constituents in the bed. In dealing with the electrical engineering problems involved in the process the work describes the electrolinking method. The results of field tests in electrolinking are provided in the work. The system of drilling gas-permeable channels from the surface to the fuel bed is described as is the method of directing the fuel gases from the bed to the surface. The electrical conductivity of the channels may be used for subsequent electrothermal fuel processing. Theoretical and laboratory experiments in this field were first started at the Energeticheskiy Institut imeni G. M. Krzhizhanovskogo (Institute of Power Engineering imeni G. M. Krzhizhanovskiy). The first experiments conducted under actual conditions were carried out at the Estonian shale deposits near the town of Kiviyli, the greater part of the work involving experiments on coal. The Institut VNIIPodzemgaz (All-Union Scientific Research Institute of Underground Gas) took an active part in the trials and established a special laboratory for the purpose. The electrolinking method was next applied at the Moscow PGU station on coal beds. Professor E. A. Meyerovich supervised the electrical engineering problems in the book and wrote Chapters 1, 3, and 8. Chapters 2, 6, part of Chapters 4 and 7 were written by S. T. Bondarenko, Candidate of Technical

Sciences (ENIN AN SSSR); Chapters 9, 4, and 7 by M. B. Brodskaya, Candidate of Technical Sciences (Institut Khimii); Chapter 11 by V. I. Pan'kovskiy, Chief Engineer of the Moscow PGU station; Chapter 10 by S. N. Lyandres, Candidate of Technical Sciences (VNIIIPodzemgaz). S. P. Vladimirov and V. K. Red'kin (ENIN AN SSSR) contributed data on electrical measurements for Chapter 5; A. D. Reznikov, Chief of the Laboratory of the VNIIIPodzemgaz Institute, assisted in compiling the joint reports of the Institute of Power Engineering and VNIIIPodzemgaz on operations conducted at the Moscow PGU station. Other personalities mentioned include: Engineers V. A. Matveyev, P. F. Skiba, and I. S. Garkuski (Glavpodzemgaz); Professor N. V. Lavrov, Doctor of Technical Sciences; I. P. Kirichenko, Candidate of Technical Sciences; Professor A. A. Agroskin; P. G. Zubkov, Candidate of Technical Sciences. The Estonian staff consisted of I. G. Kheyl', Acting Member of the Academy of Sciences, Estonian SSR; A. K. Freyberg, Chief Administrator of the Shale and Chemical Industry of Sovnarkhoz of the Estonian Republic; A. T. Kyl', Director of the Institute of Chemistry, Academy of Sciences, and I. S. Feyngol'd, Senior Scientific Worker, Institute of Chemistry, Estonian Republic. There are 60 references: 53 Soviet, 5 English, 1 German and 1 Japanese.

Title : Computation of currents and voltages in an electric power system feeding asymmetrical loads

Periodical : Elektrichestvo, 9, 32-39, S 1955

Abstract : The authors present a method of computing currents and voltages in a three-phase system feeding an unsymmetrical load at several points. The method is based on the division of the whole system into two parts: one symmetrical, the other asymmetric. The operating conditions of the symmetrical part are found by the method of symmetrical components. Currents and voltages in connecting points are determined by the method of successive approximations. The conditions of convergence applied for electric power system calculations are analyzed. The same method is applied in an example to calculate asymmetrical currents and
